# Enhancing Large Language Models with Retrieval-Augmented Generation (RAG)

- **Speaker Introduction:**

- Marina Danyalski, Senior Research Scientist at IBM Research, presents on challenges and solutions for improving Large Language Models (LLMs).

- **Key Challenges with LLMs:**

- **Lack of Sources:** LLMs often generate responses without citing reliable references.
- **Outdated Information:** Models may provide incorrect or obsolete answers due to static training data.
- **Example:** Anecdote about children asking which planet has the most moons

name is Marina Danyalski. I am a senior research scientist here at IBM

—LLMs may confidently give wrong answers without verification.

- **Solution: Retrieval-Augmented Generation (RAG):**

- **Concept:** Combines LLMs with a **content store** (e.g., internet, documents) to ground responses in real-time, reliable data.

- **Process:**

1. The LLM retrieves relevant information from a content store.
2. The query is combined with retrieved data and instructions.
3. The model generates a response grounded in verified sources.

- **Benefits of RAG:**

- **Up-to-date Information:** New data can be added without retraining the model.
- **Source Reliability:** Reduces

hallucinations and data leaks by using primary sources.

- **Honesty:** The model can admit when it lacks sufficient information.
- **Ongoing Challenges:**
  - Improving the **retriever** to provide high-quality data.
  - Enhancing the **generative model** for better response accuracy.
- **Call to Action:**
  - Encourages further learning about RAG.
  - Invites engagement (liking, subscribing) for continued discussion.

This summary captures the core insights and actionable takeaways from the meeting in a structured, professional format.

Key Decisions

Open Questions

## Action Items

No action items found.

# Chat with Your Video

Ask questions about the analysed transcript, decisions, action items and discussion.

## Shiv AI is ready

Ask anything about your video.

Example: What were the main decisions?

Shiv AI Video Assistant • Built with Python + Streamlit + AI + RAG
